ESSENTIAL INTERVENTIONS, COMMODITIES AND GUIDELINES for Reproductive, Maternal, Newborn and Child Health

A GLOBAL REVIEW OF THE KEY INTERVENTIONS RELATED TO REPRODUCTIVE, MATERNAL, NEWBORN AND CHILD HEALTH (RMNCH)
This document is designed for an audience of policy-makers who seek information on the specific health interventions to address the main causes of maternal, newborn and child deaths.

It is the result of collaborative work among many partners. The process was led by the World Health Organization, Switzerland, and the Aga Khan University, Pakistan. Experts in maternal, newborn and child health participated in meetings in Geneva in April 2010 and September 2011 and provided inputs to the development and finalization of this document. The contributions of the World Health Organization, the Aga Khan University, invited experts and partners are gratefully acknowledged.

This publication, and related advocacy material, will be distributed to over 430 PMNCH partners, and other stakeholders, primarily via the PMNCH website and knowledge portal. In addition, it will be distributed, and discussed, at selected RMNCH advocacy events.

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the World Health Organization concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted lines on maps represent approximate border lines for which there may not yet be full agreement.

The mention of specific companies or of certain manufacturers' products does not imply that they are endorsed or recommended by the World Health Organization in preference to others of a similar nature that are not mentioned. Errors and omissions excepted, the names of proprietary products are distinguished by initial capital letters.

All reasonable precautions have been taken by the World Health Organization to verify the information contained in this publication. However, the published material is being distributed without warranty of any kind, either expressed or implied. The responsibility for the interpretation and use of the material lies with the reader. In no event shall the World Health Organization be liable for damages arising from its use.

Design: Roberta Annovi.

### ADOLESCENCE & PRE-PREGNANCY
- Family planning (advice, hormonal and barrier methods)
- Prevent and manage sexually transmitted infections, HIV
- Folic acid fortification/supplementation to prevent neural tube defects

### PREGNANCY (ANTENATAL)
- Iron and folic acid supplementation
- Tetanus vaccination
- Prevention and management of malaria with insecticide treated nets and antimalarial medicines
- Prevention and management of sexually transmitted infections and HIV, including with antiretroviral medicines
- Calcium supplementation to prevent hypertension (high blood pressure)
- Interventions for cessation of smoking

### Childbirth
- Prophylactic uterotonics to prevent postpartum haemorrhage (excessive bleeding after birth)
- Manage postpartum haemorrhage using uterine massage and uterotonic
- Social support during childbirth

### PRIMARY AND REFERRAL
- Family planning (hormonal, barrier and selected surgical methods)
- Screening for and treatment of syphilis
- Low dose aspirin to prevent pre-eclampsia
- Antihypertensive drugs (to treat high blood pressure)
- Magnesium sulphate for eclampsia
- Antibiotics for preterm prelabour rupture of membranes
- Corticosteroids to prevent respiratory distress syndrome in preterm babies
- Safe abortion
- Post abortion care

### Referral*
- Family planning (surgical methods)
- Reduce malpresentation at term with External Cephalic Version
- Induction of labour to manage prelabour rupture of membranes at term (initiate labour)
- Caesarean section for maternal/foetal indication (to save the life of the mother/baby)
- Prophylactic antibiotic for caesarean section
- Induction of labour for prolonged pregnancy (initiate labour)
- Management of postpartum haemorrhage (as above plus surgical procedures)

### Community strategies
- Home visits for women and children across the continuum of care
- Women’s groups
### NEWBORN AND CHILD MORTALITY, AND PROMOTE REPRODUCTIVE HEALTH

| • Family planning advice and contraceptives  
• Nutrition counselling | • Immediate thermal care (to keep the baby warm)  
• Initiation of early breastfeeding (within the first hour)  
• Hygienic cord and skin care | • Exclusive breastfeeding for 6 months  
• Continued breastfeeding and complementary feeding from 6 months  
• Prevention and case management of childhood malaria  
• Vitamin A supplementation from 6 months of age  
• Routine immunization plus *H.influenzae*, meningococcal, pneumococcal and rotavirus vaccines  
• Management of severe acute malnutrition  
• Case management of childhood pneumonia  
• Case management of diarrhoea |
| • Screen for and initiate or continue antiretroviral therapy for HIV  
• Treat maternal anaemia | • Neonatal resuscitation with bag and mask (by professional health workers for babies who do not breathe at birth)  
• Kangaroo mother care for preterm (premature) and for less than 2000g babies  
• Extra support for feeding small and preterm babies  
• Management of newborns with jaundice (“yellow” newborns)  
• Initiate prophylactic antiretroviral therapy for babies exposed to HIV | • Comprehensive care of children infected with, or exposed to, HIV |
| * Detect and manage postpartum sepsis (serious infections after birth) | • Presumptive antibiotic therapy for newborns at risk of bacterial infection  
• Use of surfactant (respiratory medication) to prevent respiratory distress syndrome in preterm babies  
• Continuous positive airway pressure (CPAP) to manage babies with respiratory distress syndrome  
• Case management of neonatal sepsis, meningitis and pneumonia | • Case management of meningitis |

* Family planning interventions at Referral level include those provided at the Primary level
WHY REPRODUCTIVE, MATERNAL, NEWBORN AND CHILD HEALTH?

Poor maternal, newborn and child health remains a significant problem in developing countries. Worldwide, 358,000 women die during pregnancy and childbirth every year\(^1\) and an estimated 7.6 million children die under the age of five.\(^2\) The majority of maternal deaths occur during or immediately after childbirth. The common medical causes for maternal death include bleeding, high blood pressure, prolonged and obstructed labour, infections and unsafe abortions. A child’s risk of dying is highest during the first 28 days of life when about 40% of under-five deaths take place, translating into three million deaths.\(^2\) Up to one half of all newborn deaths occur within the first 24 hours of life and 75% occur in the first week. Globally, the main causes of neonatal death are preterm birth, severe infections and asphyxia. Children in low-income countries are nearly 18 times more likely to die before the age of five than children in high-income countries.\(^2\)

Good maternal health and nutrition are important contributors to child survival. The lack of essential interventions to address these and other health conditions often contribute to indices of neonatal morbidity and mortality (including stillbirths, neonatal deaths and other adverse clinical outcomes).

The highest maternal, neonatal and under-five mortality rates are in sub-Saharan Africa and in Southern Asia.\(^2\) Although substantial progress has been made towards achieving the Millennium Development Goals (MDGs) 4 and 5, the rates of decline in maternal, newborn and under-five mortality remain insufficient to achieve these goals by 2015. Interventions and strategies for improving reproductive, maternal, newborn and child health and survival are closely related and must be provided through a continuum of care approach. When linked together and included as integrated programmes, these interventions can lower costs, promote greater efficiencies and reduce duplication of resources. However, few efforts have been made to identify synergies and integrate these interventions across the continuum of care. Despite the existing plethora of knowledge, there is a lack of consensus on how best to move forward in a coordinated manner so as to achieve progress towards the MDGs. Furthermore, consensus is also needed on the level of evidence.

The foremost aim of this global review is to compile existing evidence on the impact of different interventions on the main causes of maternal, newborn and child deaths. The specific objectives of this review were to serve as a first step towards:

- Developing consensus on the content of RMNCH packages of interventions at each level of the health system across the continuum of care.
- Facilitating the scaling-up of these interventions.
- Identifying research gaps in the content of core packages of interventions.

Policy and regulatory environment

Policy and regulations are crucial to the implementation of any interventions. The recommended list of interventions should be reviewed in light of the existing national policy and regulatory environment. All interventions provided should comply with the laws and policies of the country. When required, these laws and policies may be reviewed and updated to ensure that priority life saving interventions are delivered.
**Search strategy**

A total of 142 RMNCH interventions were identified, assessed and selected for this review (there is a 700 page compilation of the evidence which underpins this short summary available at the PMNCH), based on current WHO recommendations contained in the following publications: Guidelines on HIV and Infant Feeding (2010); Integrated Management of Childhood Illness (2008); Integrated Management of Childhood Illness for high HIV settings (2008); the Pocket Book on Hospital Care for Children (2005); Integrated Management of Pregnancy and Childbirth Clinical Guidelines (2007); Recommended Interventions for Improving Maternal and Newborn Health - Integrated Management of Pregnancy and Childbirth (2007). Interventions published in the Child and Neonatal Lancet Series (2003 and 2005, respectively) as well as in the WHO Recommended Interventions for Improving Maternal and Newborn health (2010).
Inclusion criteria comprised the following: (i) the intervention has an alleged impact on reducing maternal, neonatal and child mortality; (ii) the intervention is suitable for delivery in low- and middle-income countries, and/or settings where minimal essential care is generally available; and (iii) the intervention is delivered through the health sector (community level up to the referral level of health care).

Relevant reviews for each intervention were identified from the following electronic databases: the Cochrane database of systematic reviews, the Cochrane database of abstract reviews of effectiveness (DARE), the Cochrane database of systematic reviews of randomized control trials (RCTs), and PubMed. The reference lists of reviews and recommendations from experts in the field were also used as sources to obtain additional publications. The principal focus was on the existing systematic reviews and meta-analysis.

Selection on interventions
The interventions were prioritized according to the following criteria:

- Interventions expected to have a **significant impact on maternal, newborn and child survival**, addressing the main causes of maternal, newborn and child mortality.
- Interventions suitable for implementation in **low- and middle-income countries**; minimal essential care.
- Interventions delivered through the **health sector**, from the community up to the first referral level of health service provision.

Classification of interventions
The interventions were classified into categories A, B and C, according to the framework provided in Box 1.

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>EVIDENCE FOR INTERVENTION CATEGORIES</th>
<th>DELIVERY STRATEGIES</th>
<th>ACTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Intervention evidence agreed</td>
<td>Delivery strategy agreed</td>
<td>Disseminate for rapid scale-up</td>
</tr>
<tr>
<td>B</td>
<td>Intervention evidence agreed</td>
<td>Delivery strategy no consensus</td>
<td>Collate evidence and define gaps in evidence for delivery strategies – seek consensus</td>
</tr>
<tr>
<td>C</td>
<td>Intervention evidence still questioned</td>
<td>Delivery strategy no consensus</td>
<td>Further research required</td>
</tr>
</tbody>
</table>

The classification of the effect of interventions according to the evidence available was done based on that used by the Cochrane group, as follows:

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interventions that are beneficial</td>
<td>Interventions likely to be beneficial</td>
<td>Interventions with a trade-off between beneficial and adverse effects</td>
<td>Interventions of unknown effect, including absence of reviews</td>
<td>Interventions likely to be ineffective or harmful</td>
</tr>
</tbody>
</table>

This classification benefited from being broadly known, recognized and accepted since it is the classification used by the Cochrane systematic review process that has guided this exercise from the beginning. The “evidence” was restricted to published systematic reviews; not including single studies.
The origin of evidence included the following three different levels of delivery of interventions and these were defined in the publication by the World Bank “Priorities in Health”: 4

**Community level/home**

(1) **Community level/home** - Health care providers at this level include community health workers and outreach workers. It utilizes resources such as volunteers’ time, local knowledge and community confidence and trust as channels for delivery of interventions generally related to safe motherhood, nutrition and simple prevention and treatments. Many countries have attempted to construct links between community-based health care resources and households for a range of health programmes. These programmes do not substitute for a health system, but provide a channel for reaching families with information and resources. Community health workers (CHWs) not only promote healthy behaviours and preventive action but can mobilize demand for appropriate services at other levels. The success of community health efforts depends critically on the context, including level of development of infrastructure, services and socioeconomic resources.

**First level/outreach**

(2) **First level/outreach** - Health care providers at this level of care include professionals, outreach workers as well as the community health workers. It includes a range of initiatives that are associated with the Alma Ata Declaration on Primary Health Care approved by WHO in 1978. More recently, the WHO Commission on Macroeconomics and Health described the need for developing services that are close to the client. The basic notion is a common one: recognition that a certain range of health care services must act as an interface between families and community programmes on one hand, and hospitals and national health policies on the other. There has been substantial convergence in the content of general first level primary care over time: maternity related care (for instance, prenatal care, skilled birth attendance and family planning), interventions to address childhood diseases (such as vaccine preventable diseases, acute respiratory infections, diarrhoea) and prevention and treatment of major infectious diseases.

**Referral level/district hospital**

(3) **Referral level** - This level of delivery of interventions refers to hospitals in general. These can be either district hospitals or referral hospitals. The health care providers at this level are professionals.

**District hospitals** - Generally designed to serve people with services that are more sophisticated, technically demanding and specialized than those available at a primary care facility/first level care, but not as specialized as those provided by referral hospitals. Their range of services includes diagnostics, treatment, care, counselling and rehabilitation. District hospitals may also provide health information, training and administrative and logistical support to primary and community health care programmes. They concentrate skills and resources in one place for the delivery of interventions for conditions that are either uncommon or difficult to treat. They are also a repository of knowledge and diagnostic tools for assessing whether referral to an even more specialized facility is indicated.
*Referral hospitals* - Referral hospitals provide complex clinical care interventions to patients referred from the community, primary/first, or district hospital levels. Referral hospitals need to provide many forms of support, including advice on which patients to refer, proper post discharge care and long-term management of chronic conditions. Referral hospitals can also provide important managerial and administrative support to other facilities, serving as gateways for drugs and medical supplies, laboratory testing services, general procurement, data collection from health information systems and epidemiological surveillance. They are also the vehicle for disseminating technologies by training new staff and providing continuing professional education for existing staff at different facilities.

**Evidence-based findings**

The following table lists the interventions classified as “A” based on the criteria defined in Box 1.

### Priority Interventions

#### Kangaroo mother care (KMC) for preterm and for < 2000g babies

- **Level of Care**: Primary Referral
- **Community or Professional Health Workers**: Professional health workers
- **Key Commodities (Supplemented by Annex)**:
  - Materials for counselling, health education and health promotion
  - Support Binder for KMC (KMC wrap)
  - Hat
  - Nasogastric tube
- **Practice Guidelines and Training Manuals**:
  - WHO | Kangaroo mother care: a practical guide
  - WHO, Essential newborn care course (2010) - Training Tool

#### Extra support for feeding the small and preterm baby

- **Level of Care**: Primary Referral
- **Community or Professional Health Workers**: Professional health workers
- **Key Commodities (Supplemented by Annex)**:
  - Nasogastric tubes
  - Feeding cups
  - Breast pump
  - Syringe drivers
  - Blood sugar testing sticks
  - Materials for counselling
- **Practice Guidelines and Training Manuals**:
  - WHO guide for feeding preterm and LBW babies (forthcoming in the web)
  - WHO, Essential newborn care course (2010) - Training Tool

#### Prophylactic and therapeutic use of surfactant to prevent respiratory distress syndrome in pre-term babies

- **Level of Care**: Referral
- **Community or Professional Health Workers**: Professional health workers
- **Key Commodities (Supplemented by Annex)**:
  - Surfactant
  - Oxygen supply/concentrator
  - Pulse oximeter
- **Practice Guidelines and Training Manuals**:

#### Continuous positive airway pressure (CPAP) to manage pre-term babies with respiratory distress syndrome

- **Level of Care**: Referral
- **Community or Professional Health Workers**: Professional health workers
- **Key Commodities (Supplemented by Annex)**:
  - Standard CPAP or bubble CPAP
  - Oxygen supply/concentrator
  - Pulse oximeter
- **Practice Guidelines and Training Manuals**:

#### Management of newborns with jaundice

- **Level of Care**: Primary Referral
- **Community or Professional Health Workers**: Professional health workers
- **Key Commodities (Supplemented by Annex)**:
  - Bilirubinometer
  - Phototherapy lamp
  - Eye shade
  - IV fluids
  - Exchange transfusion kit
- **Practice Guidelines and Training Manuals**:

</tbody>
</table>

**Promotion and support for exclusive breastfeeding for 6 months**

- Material for counselling, health education and health promotion, including individual and group counselling

**Community Primary Referral**

**Prevention and management of childhood malaria**

- Provision and promotion of use of insecticide treated bed nets for children
- Case management of childhood malaria

**Community Primary Referral**

- Materials for counselling, health education and health promotion
- Insecticide treated nets
- Rapid diagnostic tests
- Antimalarial drugs according to guidelines

**Practice Guidelines and Training Manuals**

**Case management of diarrhoea:**
- **a) Acute watery diarrhoea**
  - Materials for counselling, health education and health promotion
  - Zinc (tablets/solution)
  - Oral Rehydration Solution (ORS)
  - Appropriate antibiotics for dysentery according to guidelines
- **b) Dysentery**
  - Zinc (tablets/solution)
  - Oral Rehydration Solution (ORS)
  - Appropriate antibiotics for dysentery according to guidelines

**Case management of meningitis**
- Appropriate antibiotics
- Supportive treatment

CROSS-CUTTING COMMUNITY STRATEGIES

There are several cross-cutting community strategies across the continuum of care e.g. home visits\textsuperscript{59, 108}, participation of women’s groups, conditional cash transfers etc. The strategies can be used for demand creation, empowerment, service delivery etc. These will be reviewed at a later date and recommendations arising from the review will be published in a complementary document.
